Chapter 07

Processor and Memory

Computer Fundamentals - Pradeep K. Sinha & Priti Sinha
In this chapter you will learn about:

- Internal structure of processor
- Memory structure
- Determining the speed of a processor
- Different types of processors available
- Determining the capacity of a memory
- Different types of memory available
- Several other terms related to the processor and main memory of a computer system
Basic Processor & Memory Architecture of a Computer System

Central Processing Unit

<table>
<thead>
<tr>
<th>ROM</th>
<th>PROM</th>
<th>Flash</th>

Control Unit

- Decode
- Program control register
- Instruction register
- Memory address register
- Memory buffer register
- Input/Output register
- General-purpose register

Arithmetic Logic Unit

- Accumulator register
- General-purpose register
- General-purpose register

I/O Devices
Central Processing Unit (CPU)

- The *brain* of a computer system
- Performs all major calculations and comparisons
- Activates and controls the operations of other units of a computer system
- Two basic components are
  - Control Unit (CU)
  - Arithmetic Logic Unit (ALU)
- No other single component of a computer determines its overall performance as much as the CPU
Control Unit (CU)

- One of the two basic components of CPU
- Acts as the central nervous system of a computer system
- Selects and interprets program instructions, and coordinates execution
- Has some special purpose registers and a decoder to perform these activities
Arithmetic Logic Unit (ALU)

- One of the two basic components of CPU.
- Actual execution of instructions takes place in ALU.
- Has some special purpose registers.
- Has necessary circuitry to carry out all the arithmetic and logic operations included in the CPU instruction set.
CPU has built-in ability to execute a particular set of machine instructions, called its instruction set.

Most CPUs have 200 or more instructions (such as add, subtract, compare, etc.) in their instruction set.

CPUs made by different manufacturers have different instruction sets.

Manufacturers tend to group their CPUs into “families” having similar instruction sets.

New CPU whose instruction set includes instruction set of its predecessor CPU is said to be backward compatible with its predecessor.
Special memory units, called registers, are used to hold information on a temporary basis as the instructions are interpreted and executed by the CPU.

Registers are part of the CPU (not main memory) of a computer.

The length of a register, sometimes called its *word size*, equals the number of bits it can store.

With all other parameters being the same, a CPU with 32-bit registers can process data twice larger than one with 16-bit registers.
## Functions of Commonly Used Registers

<table>
<thead>
<tr>
<th>Sr. No.</th>
<th>Name of Register</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Memory Address (MAR)</td>
<td>Holds address of the active memory location</td>
</tr>
<tr>
<td>2</td>
<td>Memory Buffer (MBR)</td>
<td>Holds contents of the accessed (read/written) memory word</td>
</tr>
<tr>
<td>3</td>
<td>Program Control (PC)</td>
<td>Holds address of the next instruction to be executed</td>
</tr>
<tr>
<td>4</td>
<td>Accumulator (A)</td>
<td>Holds data to be operated upon, intermediate results, and the results</td>
</tr>
<tr>
<td>5</td>
<td>Instruction (I)</td>
<td>Holds an instruction while it is being executed</td>
</tr>
<tr>
<td>6</td>
<td>Input/Output (I/O)</td>
<td>Used to communicate with the I/O devices</td>
</tr>
</tbody>
</table>
Computer has a built-in *system clock* that emits millions of regularly spaced electric pulses per second (known as *clock cycles*).

It takes one cycle to perform a basic operation, such as moving a byte of data from one memory location to another.

Normally, several clock cycles are required to fetch, decode, and execute a single program instruction.

Hence, shorter the clock cycle, faster the processor.

Clock speed (number of clock cycles per second) is measured in Megahertz ($10^6$ cycles/sec) or Gigahertz ($10^9$ cycles/sec).
## Types of Processor

<table>
<thead>
<tr>
<th>Type of Architecture</th>
<th>Features</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>CISC (Complex Instruction Set Computer)</td>
<td>- Large instruction set</td>
<td>Mostly used in personal computers</td>
</tr>
<tr>

<table>
<thead>
<tr>
<th>Type of Architecture</th>
<th>Features</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multi-Core Processor</td>
<td>Processor chip has multiple cooler-running, more energy-efficient processing cores. Improve overall performance by handling more work in parallel. can share architectural components, such as memory elements and memory management.</td>
<td>Mostly used in high-end servers and workstations.</td>
</tr>
</tbody>
</table>
Every computer has a temporary storage built into the computer hardware.

It stores instructions and data of a program mainly when the program is being executed by the CPU.

This temporary storage is known as main memory, primary storage, or simply memory.

Physically, it consists of some chips either on the motherboard or on a small circuit board attached to the motherboard of a computer.

It has random access property.

It is volatile.
## Storage Evaluation Criteria

<table>
<thead>
<tr>
<th>Property</th>
<th>Desirable</th>
<th>Primary storage</th>
<th>Secondary storage</th>

<td>Non-volatile</td>
<td>Volatile</td>
<td>Non-volatile</td>
</tr>
<tr>
<td>Access</td>
<td>Random access</td>
<td>Random access</td>
<td>Pseudo-random access or sequential access</td>
</tr>
</tbody>
</table>
The words of a memory (total $N$ words)

Each word contains the same number of bits = word length

(Continued on next slide)
Machines having smaller word-length are slower in operation than machines having larger word-length.

A write to a memory location is destructive to its previous contents.

A read from a memory location is non-destructive to its previous contents.
Fixed Word-length Memory

- Storage space is always allocated in multiples of word-length
- Faster in speed of calculation than variable word-length memory
- Normally used in large scientific computers for gaining speed of calculation
Variable Word-length Memory

Each memory location can store only a single character.

Slower in speed of calculation than fixed world-length memory.

Used in small business computers for optimizing the use of storage space.

Note: With memory becoming cheaper and larger day-by-day, most modern computers employ fixed-word-length memory organization.
Memory Capacity

- Memory capacity of a computer is equal to the number of bytes that can be stored in its primary storage.

- Its units are:
  
<table>
<thead>
<tr>
<th>Unit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kilobytes (KB)</td>
<td>1024 ($2^{10}$) bytes</td>
</tr>
<tr>
<td>Megabytes (MB)</td>
<td>1,048,576 ($2^{20}$) bytes</td>
</tr>
<tr>
<td>Gigabytes (GB)</td>
<td>1,073,741,824 ($2^{30}$) bytes</td>
</tr>
</tbody>
</table>
Random Access Memory (RAM)

- Primary storage of a computer is often referred to as RAM because of its random access capability.
- RAM chips are volatile memory.
- A computer’s motherboard is designed in a manner that the memory capacity can be enhanced by adding more memory chips.
- The additional RAM chips, which plug into special sockets on the motherboard, are known as *single-in-line memory modules (SIMMs)*.
**Read Only Memory (ROM)**

- ROM a non-volatile memory chip
- Data stored in a ROM can only be read and used – they cannot be changed
- ROMs are mainly used to store programs and data, which do not change and are frequently used. For example, system boot program
## Types of ROMs

<table>
<thead>
<tr>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufacturer-programmed ROM</td>
<td>Data is burnt by the manufacturer of the electronic equipment in which it is used.</td>
</tr>
<tr>
<td>User-programmed ROM or</td>
<td>The user can load and store “read-only” programs and data in it</td>
</tr>
<tr>
<td>Programmable ROM (PROM)</td>
<td></td>
</tr>
<tr>
<td>Erasable PROM (EPROM)</td>
<td>The user can erase information stored in it and the chip can be reprogrammed to store new information</td>
</tr>
</tbody>
</table>

(Continued on next slide)
## Types of ROMs

(Continued from previous slide..)

<table>
<thead>
<tr>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ultra Violet EPROM (UVEPROM)</td>
<td>A type of EPROM chip in which the stored information is erased by exposing the chip for some time to ultra-violet light</td>
</tr>
<tr>
<td>Electrically EPROM (EEPROM)</td>
<td>A type of EPROM chip in which the stored information is erased by using high voltage electric pulses</td>
</tr>
<tr>
<td>Flash memory</td>
<td></td>
</tr>
</tbody>
</table>
Cache Memory

- It is commonly used for minimizing the memory-processor speed mismatch.
- It is an extremely fast, small memory between CPU and main memory whose access time is closer to the processing speed of the CPU.
- It is used to temporarily store very active data and instructions during processing.

*Cache is pronounced as “cash”*
Key Words/Phrases

- Accumulator Register (AR)
- Address
- Arithmetic Logic Unit (ALU)
- Branch Instruction
- Cache Memory
- Central Processing Unit (CPU)
- CISC (Complex Instruction Set Computer) architecture
- Clock cycles
- Clock speed
- Control Unit
- Electrically EPROM (EEPROM)
- Erasable Programmable Read-Only Memory (EPROM)
- Explicitly Parallel Instruction Computing (EPIC)
- Fixed-word-length memory
- Flash Memory
- Input/Output Register (I/O)
- Instruction Register (I)
- Instruction set
- Kilobytes (KB)
- Main Memory
- Manufacturer-Programmed ROM
- Megabytes (MB)
- Memory
- Memory Address Address Register (MAR)
- Memory Buffer Register (MBR)
- Microprogram
- Multi-core processor
- Non-Volatile storage Processor
- Program Control Register (PC)
- Programmable Read-Only Memory (PROM)
- Random Access Memory (RAM)

(Continued on next slide)
Key Words/Phrases

(Continued from previous slide..)

- Read-Only Memory (ROM)
- Register
- RISC (Reduced Instruction Set Computer) architecture
- Single In-line Memory Module (SIMM)
- Ultra Violet EPROM (UVEPROM)
- Upward compatible
- User-Programmed ROM
- Variable-word-length memory
- Volatile Storage
- Word length
- Word size
